

Autism: The Real Story

Autism is caused by electrical household items that radiate electromagnetic flux fields. These strong electromagnetic flux fields are causing an electronic mutation of the brain's frontal lobe neurons that communicate with the brain's limbic system.

The Federal Communications Commission has set a maximum electromagnetic flux field radiation exposure limit of two milligauss (mG). The five major household items that produce more than two mG of radiation are:

1. Cathode ray tube (CRT) television sets: 4 to 8 mG
2. Microwave ovens: 20 to 40 mG
3. Computer video display: 6 to 8 mG
4. Cell phones: 4 to 6 mG
5. Cordless phones: 4 to 6 mG

To understand how autism is caused by the large radiations of electromagnetic flux fields, you must understand the electronic operating conditions of the brain. To accomplish that, the following two items can be checked from www.Wikipedia.com.

1. The brain's limbic system (http://en.wikipedia.org/wiki/Limbic_system). Note the electronic conditions.
2. The brain's action potential operations (http://en.wikipedia.org/wiki/Action_potential). Note the electronic and voltage operating levels of the brain's neurons.

Conclusion

Over the last 15 years, as household electrical items have become more powerful, we have witnessed an increase in household EMF that assaults the human brain and is causing the increased incidence of autism:

- When cathode ray tube television screens increased from 20 to more than 30 inches in diameter, the radiation of EMF doubled and the autism epidemic increased.
- When microwave ovens increased in power from 800 to 1200 watts, the autism epidemic increased.
- When home computers became a staple in most U.S. households, the autism epidemic increased.
- When cell phones went from analog at 900MHz to digital at 1900 MHz, the autism epidemic increased.
- When cordless phones in the home went from 90 MHz to 900 MHz, the autism epidemic increased.
